Communications

Source: comScore Media Metrix, based on average minutes per visitor by category (8/05). Browsing / Other includes general web-surfing activity not listed in other categories, including anything from news sites (cnn.com) to retail (Amazon.com) to job sites.

US Share of Global Market

Source: AXA. Projected data for C2030E calculated using the rate of growth of market capitalization for Rest of World and USA since 1970.

Components for Innovation

- Communication and Collaboration
- Learning space (environments) and tools
 - Coursecasts, screencasts, blogs/vlogs
 - Wikis, videoconf, social bookmarks, group projects
- Bridge gap between technology and academic work.

Good teaching can sometimes overcome bad space

Technology enhanced classrooms
often mean this:

What is a learning space

Formal

Informal

Library

Studio

Hallways

Lab

Classroom

Offices

Performance Room

Courtyards

Auditorium

Cafeteria

Computer Lab

Plazas

Virtual Space

Wikis

Gaming PDAs

Blogs Cell Phones

Wireless Social Networks

RSS CMS's

Instant Messaging Digital Stories

Enrollment Trends in Distance Education In California community colleges

Discussion Questions

How can we innovate in learning?

New tools for the next-generation learners

Discussion Questions

“New markets of knowledge have ushered in new and complicated issues of intellectual property, as faculty and their employing institutions have internalized notion of the ‘production’ and ‘consumption’ of knowledge.” (p. 403)

The role of faculty is seen as knowledge consumer and knowledge producer functioning within market forces. Do you agree with this statement? Why?

Discussion Questions

“Technology opens up the possibility to rethinks of roles, time, and place, and organizational participants.” (p. 407)

What does it mean by saying roles, time, place, and organizational participants?

Discussion

New technology alters the roles of the participants; students become active rather than passive learners, and faculty become “guides on the side” rather than “sages on the stage.” Other actors, such as software developers, become increasingly important. Technology alters the time dimension: students use educational software packages at their own pace and at their convenience rather than be subjected to regimented classroom schedule. (p. 407)

Discussion Questions (p. 418)

- Will technological advances allow colleges and universities to provide a higher quality education to more people?
- Will they have make possible cost savings and productivity increases that will rescue colleges and universities from steadily tightening budgets?
- Will the advances, as some have claimed, spell the eventual demise of higher education as we know it?
